U Hlay Aung's lecture

Electric arc welding of mild steel plate in ship building has superseded riveting as the main form of structural attachment. The main advantages are

① A substantial saving in steel weight
② Economy of construction
③ Greater fabrication potential.
④ better continuity of strength
⑤ Greater freedom of design and
⑥ The provision of water tightness without caulking

On other hand, the efficiency of joint depends upon the weld and the position in which operating. Also the rapid heating and cooling tend to distort the plate and locked up stresses occur to the construction

There can be minimized if the structure is suitably prepare and the correct sequence of welding is follow.

Usual welding Process

① manual metal arc welding

A fusion weld is one where there is actual melting of the material being joined although the weld metal is composed very largely of added material which generally has the same characteristics as the parent metal. The heat necessary for making fusion welds is usually supply by electrical means. The most common of welding processes is still the one in which a manual metal arc welding with coated steel electrode.

② Automatic Arc welding.

Early effort at automation of the metal arc welding process included devices which deposited consult electrode in a prepared joint, and the limitation of the above Technique for continuous welding is the difficulty of transferring the arc from one electrode to the next without incurring corosity in the weld. The answer to the problem was found by using a coated electrode in coil form and this is usually the commonly done.

submerged arc process

This method employ a coiled bare wire and welding flux which is supply separately, as a free flowing powder. The flux is deliver from a hopper and deposited on the joint to be welded ahead of the electrode wire. The arc is completely shielded and hidden from view and is very quite and there is no alloy and no from fume or glare.

welded connections

The two basic types of welded connection are. Butt and fillet and variation of these type weld be described.

fig(1) shows a general type of butt weld and the preparation of this one shows in fig: (2) The angle of chamfer and the gap between the plates and the nosing may be sliding and different yards, These are generally prove by local Surveyors of the classification societies are before work) design began. The preparation of plate edges is done by either planning or by burning machine in the shop butt on the ship during construction the chamfer are either hand machine chipped or burned.

	Preparation	Plate thickness	Job	Method
a		under 0.63"	Plate at bottom shell seams and butts to plate deck beams bulk head beams and butt	weld (1) and (2) manual or machine.
b		over 0.63"	Bottom shell and side seams or butts bulk head deck seam and butt Tank Top seams	"
c		under 0.63"	Shell seams and butt marking and tank top centre line strake butt Bulk head seams and butts	weld (1) manual.
d		under 0.28 manual under 0.36" machine	Bulk head deck and any seams or butts to be completed with Plates Horizontal	weld (1) and (2) manual or machine.

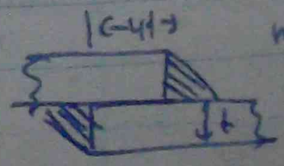

fig 4 (d) top weld.

Fig (1) Shows the basic fillet weld and weld is generally done by hand vibration of the are Shown in fig (4) The factor governing the leg length of the type of weld is the thicker of the two plate making the joint join the rules of the classification societies give the leg length in relation (important of connection and state also whether the weld is continuous or intermitted width intermitted weld the spacing of weld also stated.

Plan of weld	Type	Job
(a) 	continuous weld both sides of plate	All main water tight strength work eg bulkhead Tank top vertical centre keel Beam knees etc
(b) 	continuous weld one side inter mittent weld the other	Secondary watertight and gas tight work eg wcs galley Deck houses retri: space.
	Intermittent weld both sides - staggered	Girders, Beams bulkhead, stiff frame, floor etc.
	Intermittent weld both side - Chain.	

fig (5) fillet weld spacing

Fig 5(a) to (d) show the various continuous and intermittent weld and where they are used. Before a fillet weld is begin it should be seen that the gap between the plate is never greater than $\frac{1}{16}$" If a larger gap occur one side of the gap should be sealed by welding and then the opposite side gouged to meet the weld, before before completing the weld of the second side

The strength of welded joint depend particular (y upon the skill and reliability of the welder who must be ~~must~~ careful in cleaning the joint keeping it dry, and clearing away the slag or flux in a multirun weld. The tight, sides and shape of weld also are important. If all these points are considered, there is no reason while a first class attachment should not be produced. If there

excessive loading of any particular welded joint brake down usually occur in the plating adjacent to joint and only in the weld itself if the above points have not been followed. In both butt and fillet weld it is important that they are run towards where end, otherwise locked up stresses occur which calls cracking of weld and distortion of plating. Therefore it is important the machine joint is suitably prepared and fastened and the sequence of welding decided before the operator allowed to begin.

welding ಪ್ರಾಮುಖ್ಯತೆಗಳು:

Ship building, Railways, Motor car & aircrafts, pressure vessels, repair & maintenance

fussion welding (F.F.E.C)

ಇದರಲ್ಲಿ ಎರಡು ಲೋಹಗಳನ್ನು ಜೋಡಿಸಲು ಅವುಗಳ ಅಂಚುಗಳನ್ನು ಕರಗಿಸಲಾಗುತ್ತದೆ. ಇದನ್ನು ಎರಡು ವಿಧಗಳಲ್ಲಿ ವಿಂಗಡಿಸಲಾಗಿದೆ. (1) Fussion without mechanical press (2) fusion with mech: press ಈ ವಿಧಾನದಲ್ಲಿ ಬೆಸುಗೆ ಮಾಡಬೇಕಾದ ಲೋಹಗಳನ್ನು ಒಂದಕ್ಕೊಂದು ಸೇರಿಸಿ ಇಡಲಾಗುತ್ತದೆ.

Fusion without pressure ವಿಧಾನಗಳು:

(I) gas Process (a) oxy acetylene (b) oxy Hydrogen (c) oxy-Hydrocarbon (d) Air Acetylene

ಈ welding ಗೆ ಬಳಸುವ ಉಷ್ಣತೆ ಸುಮಾರು 3200°C ಇರುತ್ತದೆ.

(II) Arc process

(1) metal arc (3) Atomic arc (5) Submerged arc

(2) carbon arc (4) Inert gas arc (6) Electro slag.

Arc welding ನಲ್ಲಿ ಬಳಸುವ Electrode ಗಳು: electric Arc or arc ಉತ್ಪಾದಿಸಲು. ಸಾಮಾನ್ಯವಾಗಿ ಬಳಸುವ ಲೋಹಗಳು, ಇದನ್ನು ತಯಾರಿಸಲು ಬಳಸುವ ಲೋಹಗಳು: ಮೃದು ಉಕ್ಕು. ಕಾಸ್ಟ್ ಐರನ್, ಅಲ್ಯೂಮಿನಿಯಂ. ಇದನ್ನು ferrous ಮತ್ತು Non ferrous metal ಗಳಲ್ಲಿ ಬಳಸಲಾಗುತ್ತದೆ.

oxy-acetylene welding

Gas welding ಅಂದರೆ oxy acetylene welding ಆಕ್ಸಿಜನ್, acetylene ಗಳನ್ನು ಬಳಸಿ ಉಂಟುಮಾಡಿದ ಜ್ವಾಲೆಯಿಂದ ಬೆಸುಗೆ ಮಾಡುವುದು. ಈ ವಿಧಾನದಲ್ಲಿ ಸುಮಾರು 3500°C ತಾಪಮಾನ ಉತ್ಪತ್ತಿಯಾಗುತ್ತದೆ. ಇದರಿಂದ metal ಗಳನ್ನು ಕರಗಿಸಿ ಬೆಸುಗೆ ಮಾಡಲಾಗುತ್ತದೆ. ಇದಕ್ಕೆ fusion welding ಅಥವಾ metal Rod ಎಂದು ಕರೆಯುತ್ತಾರೆ.

ಈ ವಿಧಾನದಲ್ಲಿ ಕರಗಿದ ಲೋಹಗಳು ಆಕ್ಸೈಡ್ ಆಗದಂತೆ molten metal ಅನ್ನು ರಕ್ಷಿಸಲು, ಅದಕ್ಕೆ ಫ್ಲಕ್ಸ್ ಅನ್ನು ಬಳಸಲಾಗುತ್ತದೆ. ಈ ವಿಧಾನದಲ್ಲಿ metal ಗಳಾದ nitrides & oxides ಗಳನ್ನು ತೆಗೆದುಹಾಕಿ joint ನ್ನು ಸರಿಯಾಗಿ ಬೆಸುಗೆ ಮಾಡಲಾಗುತ್ತದೆ.

(ii) carburising flame -

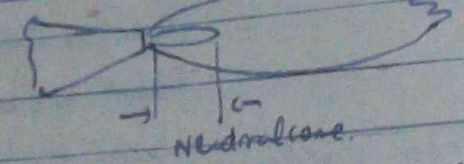
(3) Neutral flame



oxygen & acetylene ಅನಿಲಗಳ ಸಮಪ್ರಮಾಣದ ಮಿಶ್ರಣದಿಂದ ಉಂಟಾಗುವ ಜ್ವಾಲೆಯನ್ನು neutral flame ಎನ್ನುವರು. ಇದರಲ್ಲಿ ಆಮ್ಲಜನಕ ಮತ್ತು ಅಸಿಟಿಲೀನ್ ಅನಿಲಗಳು ಸಮಪ್ರಮಾಣದಲ್ಲಿ ಇರುತ್ತವೆ. ಇದರಲ್ಲಿ ಮೂರು ಭಾಗಗಳಿರುತ್ತವೆ.

In this flame, metal ಅನ್ನು ಕರಗಿಸಿದಾಗ ಉಂಟಾಗುವ ಆಕ್ಸೈಡ್‌ಗಳನ್ನು ಅಥವಾ ಕಾರ್ಬೈಡ್‌ಗಳನ್ನು ಕರಗಿಸಿ ಅವುಗಳ ಪರಿಣಾಮವನ್ನು ತಟಸ್ಥಗೊಳಿಸುತ್ತದೆ.

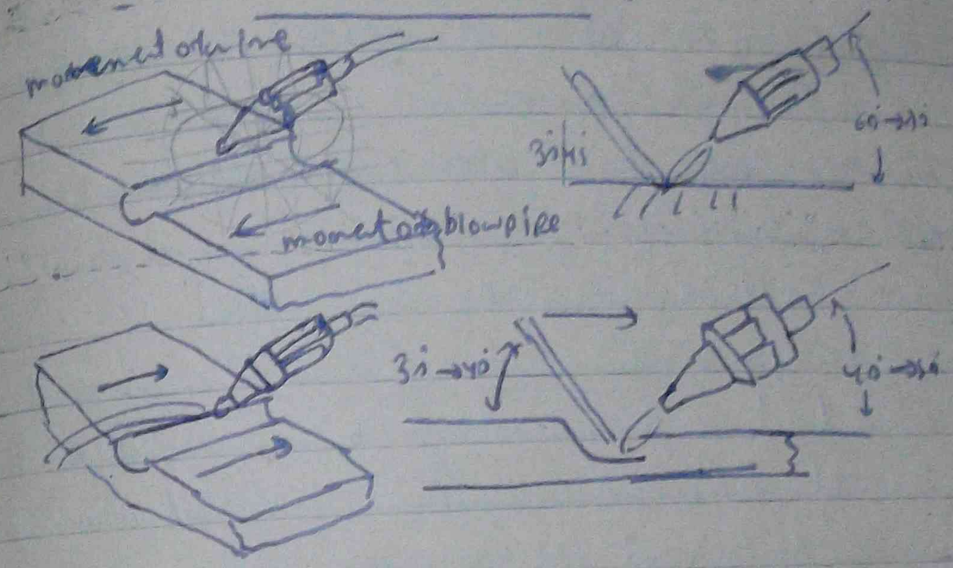
Method of welding



ಪ್ರಾರಂಭದ ಸಲ ಪ್ರಾಯೋಗಿಕವಾಗಿ ಸುಮಾರು ಫಲಕಗಳನ್ನು left ward or forward method (ಅ) rightward or Backward welding method ಮಾಡಿ ನೋಡಿ

left ward or forward ವಿಧಾನದಲ್ಲಿ ಬೆಸುಗೆ ಕೆಲಸವನ್ನು ಬಲಗಡೆಯಿಂದ ಎಡಗಡೆಗೆ ಸಾಗಿಸಲಾಗುತ್ತದೆ. flame ಅನ್ನು unwelded portion ಮೇಲೆ ಹಿಡಿದಿರಬೇಕು. ಇದು ಕರಗಿದ ಲೋಹವನ್ನು ಕಾಪಾಡಲು flame ಅನ್ನು ಸ್ವಲ್ಪ ಹಿಂದಕ್ಕೆ ಸರಿಸಿ ಹಿಡಿಯಬೇಕು. distortion ಕಡಿಮೆಯಾಗಿರುತ್ತದೆ. molten metal ಅನ್ನು ಹಿಡಿದಿಡಲು metal plate ಅನ್ನು 30° ದಿಂದ 60° ವರೆಗೆ ಓರೆಯಾಗಿಸಿ ಇಡಬೇಕು. ಸಾಮಾನ್ಯವಾಗಿ $\frac{1}{4}$" steel plate ಬಳಸಲಾಗುತ್ತದೆ. Non ferrous metal ಗಳಿಗೆ ಇದಕ್ಕಿಂತ ದಪ್ಪವಾದ ಪ್ಲೇಟ್ ಬಳಸಲಾಗುತ್ತದೆ.

Backward ವಿಧಾನದಲ್ಲಿ ಬೆಸುಗೆ ಕೆಲಸವನ್ನು ಎಡಗಡೆಯಿಂದ

Blowtorch soldering irons can be heated in various ways, but the gasoline blowtorch is one of the most convenient ones aboard ships. As shown in figure 2(6), 1/16" nozzle form
Eight blowtorches are usually equipped with a hook and swivel to hold the soldering iron while the [illegible] exposed to the flame of torch.

Before using a blowtorch it is advisable to consider the danger of fire. Do not light or use the torch near [illegible] where gasoline has been spilled, or where [illegible] accumulated or may be expected. [illegible] good practice to have a fire extinguisher handy whenever a blowtorch is used.

In order to use a blowtorch, the tank must contain clean, white (unleaded) gasoline. And the pump on the tank must be operated to build up sufficient pressure to cause the gasoline to spray through the burner tube when the valve is opened. A piece of sheet metal or other convenient means is provided to shield the end of the burner tube and the valve is opened slightly, allowing liquid gasoline to collect in fuel pan.

With the valve closed and the blowtorch placed so as not to cause fire or damage to material and not subject to violent currents, ignite the gasoline in the fuel pan and permit the flame from the burning gasoline to envelop and heat the burner tube. When the burner tube is hot, open the valve slightly to permit a fine stream of gasoline to be discharged from the tank. The gasoline should vaporize immediately and burn with an almost colorless, slight blue flame. Before proper heat is [illegible] to permit satisfactory operation, burner torch is burning satisfactorily, valve can be opened or closed slightly in order to adjust the flame to the desired intensity. A blue flame indicates good combustion conditions, while dark [illegible] air is necessary to valve. The pump is [illegible] periodically in order to maintain pressure in tank.

- To extinguish a blow torch, close the v/v after the torch has been extinguished - it is good practice to loosen the filling plug and release the pressure within the tank. When the pressure has been relieved, the filling plug is tightened again.

The v/v is then opened slightly and left open. If the v/v is not left open the metal around the v/v will contract and the v/v spindle is so tight by that it will be damaged

waiter
yes

Fluxes A flux is a chemical preparation (powder, paste or liquid) used to keep chemical clean so that the solder will stick to it. When a flux is heated, the heat will cause oxides to form on the metal surface and prevent the solder from adhering properly. A list of common fluxes and the metals on which they are used is given in the following:-

Metals	Fluxes
Copper, brass	Resin
Lead	Tallow, resin
Iron, steel	Resin, zinc chloride

Fluxes are either corrosive or non-corrosive. The commonly used corrosive fluxes are zinc chloride, and ammonium chloride, made the metal It allowed to remain on it after soldering They should therefore be completely removed by washing after the work is done. It After washing in water, traces of flux left after Incorrect soldering, a non-corrosive flux is used when soldering electrical connections. The

Tinning - Spreading a thin layer of solder on the surface of the metals that are to be soldered together causing the solder to adhere to the metal and make a firm union with it. The purpose of tinning is to prepare the surfaces so that they will unite readily in the process of soldering, and make a firm joint. All recommended that all metals except lead & tin, be tinned before soldering, lead & tin need only to be scraped clean.

Copper brass and ungalvanized iron can easily be prepared to receive solder by cleaning the surface and applying zinc chloride. Galvanized iron or steel should be cleaned with muriatic acid before the solder is applied. Where a metal has become tarnished it is necessary to remove the tarnish and expose the bare, clean metal before tinning it, otherwise the solder ordinarily will not adhere to the metal.

Tinning the soldering iron. The point of a soldering iron must be tinned before it will do a good job of soldering. Tinning in this instance refers to the process of coating the point with solder to prevent oxidation when heated. The general steps in tinning procedure are as follows.

1. File the faces of the point clean with emery cloth and leave smooth and flat.
2. Heat the point hot enough to melt the solder readily, but do not heat it red hot.
3. Rub the faces of the point on sal-ammoniac or block, applying a small amount of solder to the points as it is rubbed on the salt. The solder will form a thin bright film on the faces of the point.
4. If a sal-ammoniac block is not available, the point can be tinned by rubbing it in pulverized rosin and solder. When a soldering iron is over heated the tinning is destroyed. If this happens the point should be allowed to cool and then should be filed and retinned.

Dipping Solution - When soldering is heated the scale must first form on the point can be removed by dipping the point in the dipping solution made of one part of sal-ammoniac powder mixed with 40 parts of water. Only the tip of the point should be dipped in the solution and it should be withdrawn quickly. The tinned point will emerge bright and clean.

A soldering iron should never be dipped into zinc chloride or muriatic acid solution, as the acid during sputter will destroy clothing, and possibly cause blindness or severe burns.
